Astronomical Instrumentation Lab – IEE 3873

Galileoscope

Purpose:

Mount and characterize a simple visual refracting telescope, measure its field of view and magnification

We learn:

- not to break things !
- to handle lenses – lenses must be held by the edge not to leave fingerprints on the surface and damage the coating
- to assemble a simple optical system and make simple observations with it
- the practical meaning of the pupil
- to keep things ordered in the Lab
- ……

Procedure:

Mount the telescope following the instructions included in the box.

For the different configurations of the telescope measure Field of view and Magnification. For one configuration of your choice measure the angular resolution of the telescope.

Write a complete report of your work.
